

Project Update

1/20/2017

The Long-term Flood Recovery Plan project team has made progress since the last project update on December 7, 2016. The project team has made progress on several items that were included in the December update:

- Data collection from public agencies is nearing completion. Miscellaneous data is requested as needed.
- The Rapid Assessment (Structural Inventory) of homes in the floodplain is in the final stages and will be completed soon.
- Consideration and development of short-term and long-term structural alternatives is currently ongoing.
- Identification of candidates for non-structural alternatives is in the preliminary phase.
- Existing conditions hydrologic and hydraulic modeling has begun and calibration to the Tax Day Flood (April 18, 2016) is nearing completion.
- The preliminary environmental desktop review has been completed.
- Analysis of alternatives has begun and will be ongoing for the next few months.

In addition to the above, Dannenbaum Engineering Corporation and the City of Jersey Village attended a meeting with the Harris County Flood Control District for education on federal flood mitigation programs. Other tasks are not yet underway, such as the economic analysis, and the final environmental review. Overall, the project is on schedule and making good progress toward the end goal: A hydraulically, economically, environmentally, and socially feasible Long-term Flood Recovery for the City of Jersey Village. The next project update will be posted in early February. Updates for the project will be posted monthly until the publication of the final plan.
